

## ABSTRACT

There is provided a data processing device capable of easily creating a message based on a received message by the same procedure or configuration used when the  
5 message was created. Template data includes a display area and a creation area. When the data processing device displays a message from the template data, the display area is extracted and used. When the data processing device creates a message based on the template data, the creation area is extracted and used. The display area, the creation area and the message are transmitted to another device. On the reception side  
10 of the message, an operation area is extracted, and another message data can be easily created with the same operation used when the received message was created.
